Monday, May 11, 2020 9:35 AM

**ASP.NET MVC <--- Application Framework <---- Helps you develop the application**

**.NET Core Application <----- Runtime Framework/Platform <----- helps you execute the application**

# Http Protocol

Monday, May 11, 2020 10:03 AM

<http://m.facebook.com> <---- Open Mobile Site

<http://www.irctc.co.in/mobile>

GET m.facebook.com/ \r\n  
User-Agent: chrome, windows10\r\n

It is a contradiction between  
the URL and the User-Agent

Url --> give me mobile site  
User-Agent --> give me desktop site

Saw

GET /some/url  
**connection: keep-alive**

- Request to keep the connection alive
- Don't close the Tcp socket (Please)
- Browsers almost always send this header to the client
- Server can (and very often does) ignore this request

<https://books.org/list?cat=thriller>

<https://amazon.in/proucts?q=mobile-cover&model=samung-note-8>

Server Response

200 OK  
Content-type:text/html  
**date-modified:2020/04/13**

Clients second request

How will server connect a user to its session when socket is disconnected.

Monday, May 11, 2020 10:36 AM

# Cache Redirect

Monday, May 11, 2020 11:28 AM

## Server Response

200 OK  
Content-type:text/html  
**date-modified:2020/04/13**

## Client Next Response

GET /resource  
**if-modified-since:2020/01/30**

//content changed after clients previous visit

200 OK  
Content-type:text/html  
**date-modified:2020/04/13**

**Gets new Data**

## Client Next Response

GET /resource  
**if-modified-since:2020/05/04**

//content not modified after the last visit

**304 Not Modified**  
\r\n

Cache Redirect

Can use the existing

# MVC

# Standard Network Port

Tuesday, May 12, 2020 9:26 AM

As an admin I can run any server on any available (free) port.

One Machine ----> One Port ----> One App (One socket)

Standard Practice

First 1K port is reserved for standard protocol

- 20,21 ----> FTP
- 25 ----> SMTP
- 80 ----> HTTP
- 110 ----> POP
- 443 ----> HTTPS

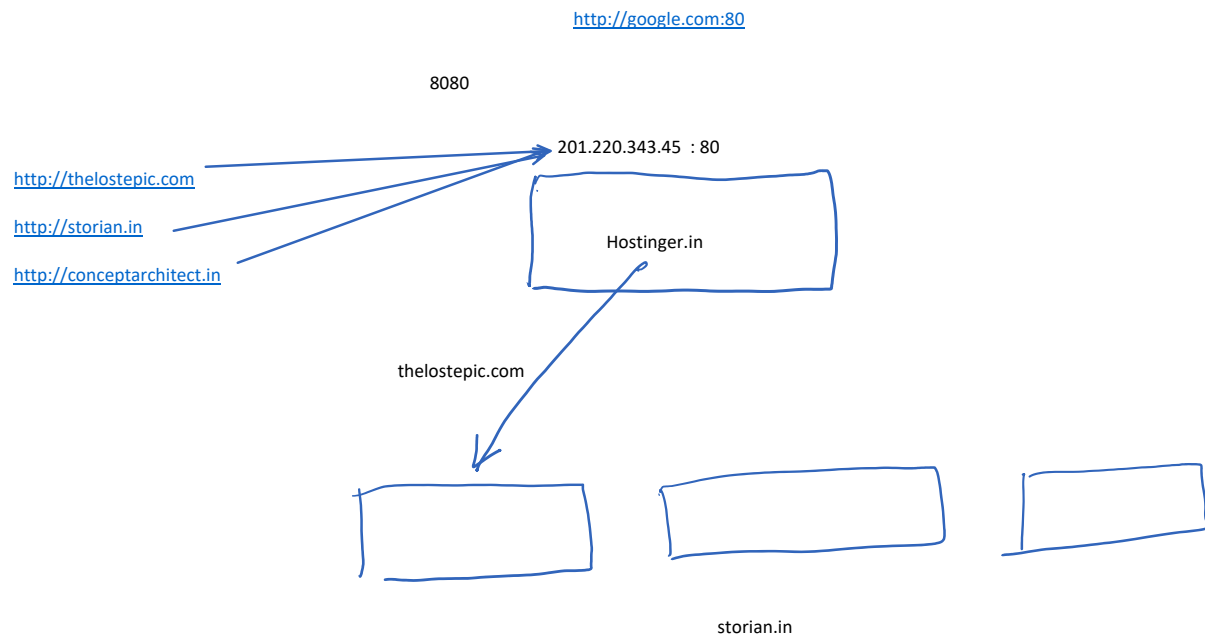

Q. What if I run HTTP Server on a Non Standard Port

A. The URL Will Change

a. <http://books.org:3393/books>

- now we say the server will be available on port 3393.

- You can imagine that default url is a shortform for
  - <http://books.org:80/books>
  - <http://books.org:445/books>

# MVC URL

Tuesday, May 12, 2020 10:00 AM

## Traditional View

<http://localhost:57586/> <----- index.html/default.html/default.aspx/default.php ---> from root directory

<http://localhost:57586/Home/Contact> <----- index.html/default.html/default.aspx from /Home/Contact directory

<http://localhost:57586/Home/About>

<http://localhost:57586/books.html> <----- request for books.html file in root directory

<http://localhost:57586/Home/About/authors.aspx> <---- execute authors.aspx page from /Home/About folder

# How Fiddler Works

Tuesday, May 12, 2020 10:41 AM

# Controller--->Action--->ActionResult

Tuesday, May 12, 2020 11:38 AM

1. An Url is a request for a **Controller** to perform some **Action**
2. Once an Action is performed it returns an **ActionResult**
3. ActionResult is returned to the User As a **View**

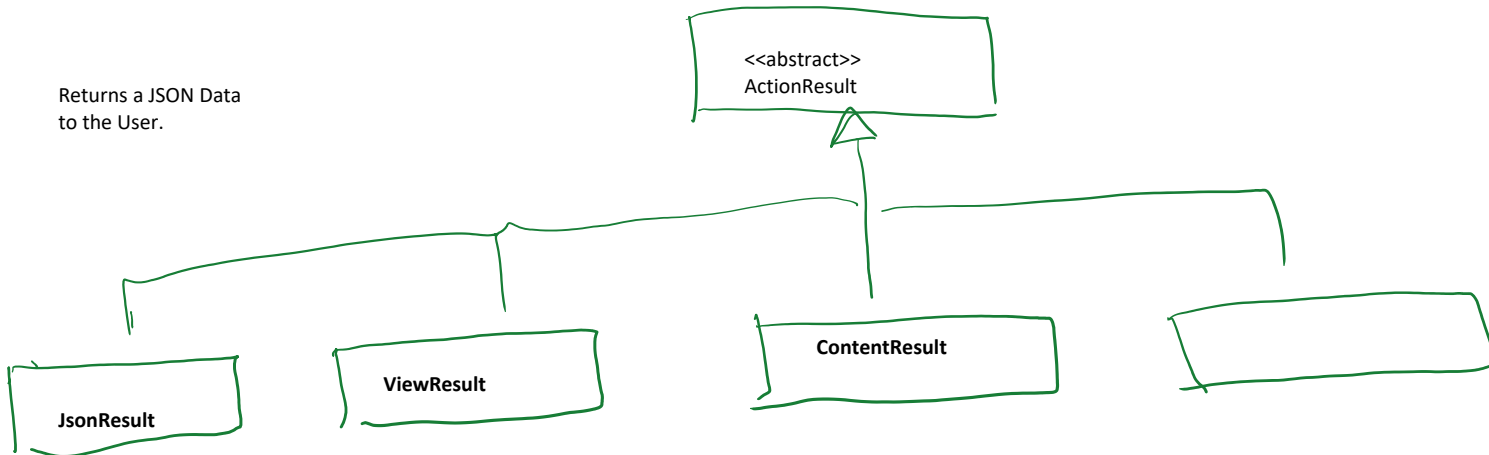

**Controller** ----> is an object

**Action** ----> is what controller do

**ActionResult** ----> return of the Action

**View** ----> what user sees (ActionResult)

Returns a JSON Data  
to the User.

## ViewResult

ViewResult uses a ViewEngine  
to generate a dynamic Html View  
using Model Data and a ViewTemplate

## ContentResult

One of the simplest ActionResult  
It returns a given String content to the user  
without any processing.

If your **Action** is not returning an **ActionResult**  
The current object is automatically converted to  
**ContentResult** by the controller

A code like

```
public Person Contact()
{
    var p=new Person();
    return p;
}
```

**Is internally converted to (psudocode)**

```
public ContentResult Contact(){
    var p=new Person();
    return new ContentResult()
    {
        Content=p.ToString()
    };
}
```

**This happens with the base Controller**

# Razor view engine processing

Tuesday, May 12, 2020 12:26 PM

Razor is one of the simplest view engine to combine view template (HTML) with C# Code (**CS+HTML = CSHTML**)

```
<h2>Welcome To Philips Server</h2>
@{
    //this is a c# code block. you can write any c# here
    var date = DateTime.Now;
}
<p><strong>Date is </strong>@date.ToLongDateString()</p>
<p><strong>Time is </strong>@date.ToLongTimeString()</p>
```

## Razor Block Code

```
@{
    //razor block
}
```

You can write any processing statement, assignments etc in this block. This block doesn't have direct output on the screen unless you write `Response.Write()`

## Razor Display Expression

`@something`

It is a shortcut for

```
@{ Response.Write(something); }
```

Notice there is no semicolon after simple razor expression what ever you type automatically used as argument to `Response.Write()`

Also Note `@` is automatically closed when it finds html code
